2. Size of file/files should be between 100kb-1000kb in jpg/jpeg/pdf format only.

All scanned/uploaded photographs/signature and documents/certificates must be clear and legible for viewing including print-out use for which the responsibility lies solely on the candidate.

ANNEXURE II

SCORE NORMALISATION

i) About Normalization

Normalization means adjusting values measured on different scales to a notionally common scale.

ii) Need for Normalization in Exam

Exam pertaining for a particular post/course could be spread across multiple shifts which will have different question paper for each shift. The normalization is to be done by considering the difficulty level of each set, since the questions may be different in different sets and difficulty level of a particular set may be different from other sets.

Hence the normalization of scores needs to be carried out for all the candidates who had written the exam, across shifts for the same post/course.

iii) Normalization Method (Z Score Method)

The following has to be calculated for every shift for all the candidates who have written the exam for the same post:

a. Average score for each Shift

X_{av} = total marks scored by candidates in a shift divided by no. of candidates in the shift.
C

b. Standard Deviation of score for each Shift. Standard Deviation is a measure that is used to quantify the amount of variation of a set of data values:

N = Number of candidates

X = Raw score of candidates

L = Total Raw score for all candidates in a shift

X_{av} = Average which is total marks divided by no. of candidates.

x = Raw Score of Candidate - Simple Average (X-X_{av})

Standard Deviation (S) = $\sqrt{(\sum x^2)/N}$

iv) Normalization Formula:

Normalized Score for each candidate (X_n) = $X_n = (S_2 / S_1) * (X - X_{av}) + Y_{av}$

S2	Is the SD of the shift with the Highest Average Score taken as Base for normalization (Criteria for choosing the base for normalization is generally taken as the shift with 'Highest Average' of raw scores)
S1	Standard Deviation for the corresponding shift (to be scaled to S2)
X	Raw score of a candidate
X_{av}	Simple average of the Shift
Y_{av}	Average corresponding to shift with highest Average (taken as Base for normalization)

Criteria for choosing the base for normalization is generally taken as the shift with 'Highest Average' of raw scores. Only exception is made if this shift (with highest average) has far less number of candidates as compared to other shifts. In that case we take the next shift with 'highest Average' as base for normalization.

70% of the average attendance is the limit. Any value below this should not be considered for the base.
