

## Solutions

**S1.** Ans. (d)

$$\begin{aligned} \text{Excess force} &= T \times 2\pi R \\ &= \frac{7}{100} \times 2 \times 3.14 \times \frac{4.5}{100} \\ &= 197.82 \times 10^{-4} \\ &= 19.8 \times 10^{-3} \text{ N} \\ &= 19.8 \text{ mN.} \end{aligned}$$

**S2.** Ans. (d)

$$\begin{aligned} \text{Surface energy of bubble} &= 2 \times \text{change in surface area} \times \text{surface tension} \\ &= 8\pi R^2 \times T \\ &= 8 \times 3.142 \times 4 \times 10^{-4} \times 3 \times 10^{-2} \text{ J} \\ &= 30.1 \times 10^{-5} \text{ J} \end{aligned}$$

**S3.** Ans. (c)

Factual (theory based)

**S4.** Ans. (a)

Initially speed is zero, then increases & after some time it becomes constant. Acceleration (slope of  $v/t$  curve) of ball first decreases and after some time it becomes zero.

**S5.** Ans. (d)

$$\begin{aligned} P &= P_0 + \frac{4T}{R} \\ \Rightarrow R \text{ increases and } P \text{ decreases} \end{aligned}$$

**S6.** Ans. (b)

Hint: In a capillary tube force of surface tension balances the weight of water in capillary tube

$$F_s = 2\pi r T \cos\theta = mg$$

Here,  $T$  and  $\theta$  are constant

So,  $m \propto r$

$$\text{Hence, } \frac{m_2}{5.0} = \frac{2r}{r}$$

$$\Rightarrow m_2 = 10.0 \text{ g}$$

**S7.** Ans. (b)

Hint: When angle of contact  $\geq 90^\circ$  then liquid doesn't wet solid.

**S8.** Ans. (a)

Hint: According to the question

$$76 \text{ cm} \times \rho_{Hg} \times g = h \times \rho_L \times g$$

$$h = 76 \text{ cm} \times \frac{\rho_{Hg}}{\rho_L} = 76 \text{ cm} \times \frac{13600}{760} = 13.6 \text{ m}$$

**S9.** Ans. (c)

Hint: Excess pressure =  $\frac{4T}{R}$ ,

$$\text{Gauge pressure} = \rho g Z_0$$

Pressure at equation

$$P_0 + \frac{4T}{R} = P_0 + \rho g Z_0$$

$$Z_0 = \frac{4T}{R \times \rho g}$$

$$Z_0 = \frac{4 \times 2.5 \times 10^{-2}}{10^{-3} \times 1000 \times 10} \text{ m}$$

$$Z_0 = 1 \text{ cm}$$

**S10.** Ans. (a)

Hint:

Rate of flow liquid

$$Q = Au = A\sqrt{2gh}$$

$$\begin{aligned}
 &= 2 \times 10^{-6} m^2 \times \sqrt{2 \times 10 \times 2} m/s \\
 &= 2 \times 2 \times 3.16 \times 10^{-6} m^3/s \\
 &= 12.64 \times 10^{-6} m^3/s \\
 &= 12.6 \times 10^{-6} m^3/s
 \end{aligned}$$

**S11.** Ans. (a)

Hint: Rate of heat produced =  $F_v \cdot v_{terminal}$

$$\frac{dQ}{dt} = F_v \cdot v_T$$

$$= 6\pi\eta r v_T \cdot v_T$$

$$\propto r \cdot v_T^2$$

$$\propto r \cdot r^4 \quad [\because v_T \propto r^2]$$

$$\propto r^5$$

**S12.** Ans. (c)

Hint:

$P_B = P_C$  (pressure at same level is same)  
[Pascal law]

$$h\rho_{oil}g = h\rho_w g$$

$$(65 + 65 + 10) \times 10^{-3} \times \rho_0 = (65 + 65) \times 10^{-3} \times 10^3$$

$$140 \rho_0 = 130 \times 10^3$$

$$\rho_0 = \frac{130}{140} \times 10^3$$

$$\rho_0 = 928 \text{ kgm}^{-3} \text{ (approx)}$$

**S13.** Ans. (c)

Hint:

$$F_v = \eta A \frac{dv}{dx}$$

$$mg - F_v = ma$$

$$\therefore a = 0$$

$$mg = F_v$$

$$mg = \eta A \frac{dv}{dx}$$

$$\eta = \frac{0.02 \times 10 \times 0.6 \times 10^{-3}}{0.2 \times 0.17}$$

$$\eta = 3.45 \times 10^{-3} \text{ Pa-s}$$

**S14.** Ans. (d)

$$\text{Hint: } h = \frac{2T \cos \theta}{\rho g r}$$

As  $r, h, T$  are same,  $\frac{\cos \theta}{\rho} = \text{constant}$

$$\Rightarrow \frac{\cos \theta_1}{\rho_1} = \frac{\cos \theta_2}{\rho_2} = \frac{\cos \theta_3}{\rho_3}$$

As  $\rho_1 > \rho_2 > \rho_3$

$$\Rightarrow \cos \theta_1 > \cos \theta_2 > \cos \theta_3 \Rightarrow \theta_1 < \theta_2 < \theta_3$$

As water rises so  $\theta$  must be acute

$$\text{So, } 0 \leq \theta_1 < \theta_2 < \theta_3 < \frac{\pi}{2}$$

**S15.** Ans. (d)

Hint:  $W = T(2\Delta A)$   $\{\Delta A = (20 - 8) \text{ cm}^2\}$

$$\Rightarrow T = \frac{W}{2\Delta A} = \frac{3 \times 10^{-4}}{2 \times 12 \times 10^{-4}} = 0.0125 \text{ Nm}^{-1}$$

**S16.** Ans. (d)

Hint:

For equilibrium.

$$U_1 + U_2 = mg$$

$$AL[1-p]g \times \rho + ApL \rho g = \rho_b ALg$$

$$ALg\rho [1-p+np] = \rho_b ALg$$

$$d = \rho_b = \rho[1+(n-1)p]$$

**S17.** Ans. (b)

Hint: By Bernoulli's equation

$$P + \frac{\rho v^2}{2} = P_0$$

$$P_0 - P = \frac{\rho v^2}{2}$$

$$F = (P_0 - P)A$$

$$F = \frac{\rho v^2 A}{2}$$

$$F = 2.4 \times 10^5 \text{ upward}$$

**S18.** Ans. (c)

Hint: The liquid meniscus adjusts its radius of curvature so that  $hR = \text{constant}$ .

**S19.** Ans. (c)

Hint: As surface area decreases so energy is released. Released energy

$$= 4\pi R^2 T [n^{1/3} - 1] \text{ where } R = n^{1/3} r$$

$$= 4\pi R^3 T \left[ \frac{1}{r} - \frac{1}{R} \right]$$

$$= 3VT \left[ \frac{1}{r} - \frac{1}{R} \right]$$

**S20.** Ans. (a)

Hint: The wettability of a surface by a liquid depends primarily on angle of contact between the surface and the liquid

**NEET**
